The Walking Adjunction

Definition 1.1.1.1. The walking adjunction is the bicategory Adj freely generated by¹

- Objects. A pair of objects A and B;
- Morphisms. A pair of morphisms

$$L: A \to B,$$

 $R: B \to A;$

• 2-Morphisms. A pair of 2-morphisms

$$\eta: \mathrm{id}_A \to L \circ R,$$
 $\epsilon: R \circ L \to \mathrm{id}_B;$

 $^{^1\}mathrm{See}~[\overline{\mathrm{SS86}}]$ for an explicit description of the 2-category (as opposed to a bicategory) version of Adj in terms of finite ordinals, similar to the description of the 2-category version of the walking monad (??) as a subcategory of Δ .

subject to the equalities

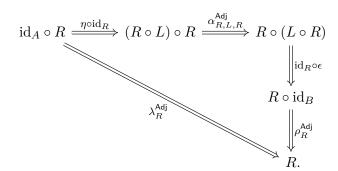

of pasting diagrams, which are equivalent to the following conditions:

1. The Left Triangle Identity. The diagram

commutes.

2. The Right Triangle Identity. The diagram

1.2 Internal Adjunctions

Let C be a bicategory.

Definition 1.2.1.1. An internal adjunction in $C^{2,3}$ is a 2-functor $Adj \rightarrow C$.

Remark 1.2.1.2. In detail, an internal adjunction in C consists of

- Objects. A pair of objects A and B of C;
- Morphisms. A pair of morphisms

$$L: A \to B,$$

 $R: B \to A$

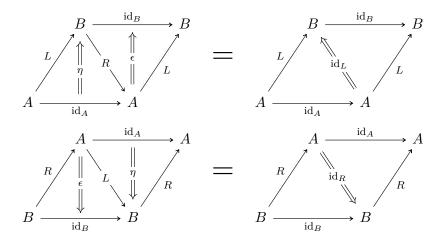

of C;

• 2-Morphisms. A pair of 2-morphisms

$$\eta: \mathrm{id}_A \to L \circ R,$$
 $\epsilon: R \circ L \to \mathrm{id}_B$

of C;

subject to the equalities

 $^{^2\}mathit{Further\ Terminology:}$ Also called an adjunction internal to C.

³Further Terminology: In this situation, we also call (g, f) an adjoint pair, f the left adjoint of the pair, g the right adjoint of the pair, η the unit of the adjunction, and ϵ

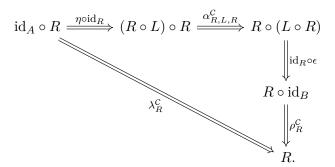

of pasting diagrams in C, which are equivalent to the following conditions:⁴

1. The Left Triangle Identity. The diagram

commutes.

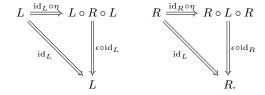

2. The Right Triangle Identity. The diagram

Example 1.2.1.3. Here are some examples of internal adjunctions.

1. Internal Adjunctions in Cats₂. The internal adjunctions in the 2-category Cats₂ of categories, functors, and natural transformations are precisely the adjunctions of Categories, ??.

 $^{^4}$ When C is a 2-category, these diagrams take the following form:

the **counit** of the adjunction.

- 2. Internal Adjunctions in **Rel**. The internal adjunctions in **Rel** are precisely the relations of the form $Gr(f) \dashv f^{-1}$ with f a function; see Relations, Item 4 of Proposition 2.5.1.1.
- 3. Internal Adjunctions in Span. The internal adjunctions in Span are precisely the spans of the form

with ϕ an isomorphism; see Spans, Item 4 of Proposition 2.5.1.1.

Proposition 1.2.1.4. Let C be a bicategory.

- 1. Duality. Let (f, g, η, ϵ) be an internal adjunction in C.
 - (a) The quadruple (g, f, η, ϵ) is an internal adjunction in C^{op} .
 - (b) The quadruple (g, f, ϵ, η) is an internal adjunction in C^{co} .
 - (c) The quadruple (f, g, η, ϵ) is an internal adjunction in C^{coop} .
- 2. Uniqueness of Adjoints. Let (f, g, η, ϵ) and $(f, g', \eta', \epsilon')$ be internal adjunctions in C. We have a canonical isomorphism⁵

$$g \xrightarrow{(\lambda_g^C)^{-1}} \mathrm{id}_A \circ g \xrightarrow{\eta' \circ \mathrm{id}_g} (g' \circ f) \circ g \xrightarrow{\alpha_{g',f,g}^C} g' \circ (f \circ g) \xrightarrow{\mathrm{id}_{g'} \circ \epsilon} g' \circ \mathrm{id}_B \xrightarrow{(\rho_{g'}^C)^{-1}} g'$$
 with inverse

$$g' \xrightarrow{(\lambda_{g'}^C)^{-1}} \operatorname{id}_B \circ g' \xrightarrow{\eta \circ \operatorname{id}_{g'}} (g \circ f) \circ g' \xrightarrow{\alpha_{g',f,g}^C} g \circ (f \circ g') \xrightarrow{\operatorname{id}_g \circ \epsilon'} g \circ \operatorname{id}_B \xrightarrow{(\lambda_g^C)^{-1}} g.$$

3. Carrying Internal Adjunctions Through Pseudofunctors. Let $F: \mathcal{C} \longrightarrow \mathcal{D}$ be a pseudofunctor and (f, g, η, ϵ) be an internal adjunction in \mathcal{C} . There is an induced internal adjunction⁶

$$(F(f), F(g), \overline{\eta}, \overline{\epsilon})$$

in \mathcal{D} , where:

 $^{^5} Slogan:$ Left adjoints are unique up to canonical isomorphism. Dually, so are right adjoints.

 $^{^6}$ Warning: Lax or oplax functors which are not pseudofunctors need not preserve

(a) The unit

$$\overline{\eta} : \mathrm{id}_{F(A)} \Longrightarrow F(g) \circ F(f)$$

is the composition

$$\operatorname{id}_{F(A)} \xrightarrow{F_A} F(\operatorname{id}_A) \xrightarrow{F(\eta)} F(g \circ f) \xrightarrow{F_{g,f}^{-1}} F(g) \circ F(f).$$

(b) The counit

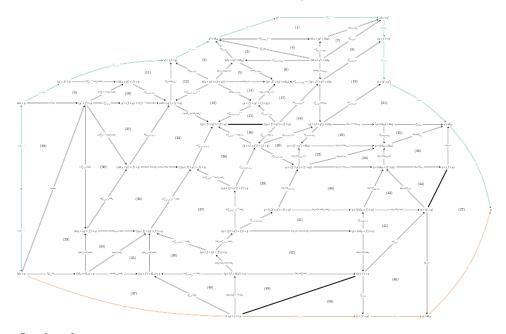

$$\overline{\epsilon} \colon F(f) \circ F(g) \Longrightarrow \mathrm{id}_{F(B)}$$

is the composition

$$F(f) \circ F(g) \xrightarrow{F_{f,g}} F(f \circ g) \xrightarrow{F(\epsilon)} F(\mathrm{id}_B) \xrightarrow{F_B} \mathrm{id}_{F(B)}.$$

Proof. Item 1, Duality: Omitted.⁷

Item 2, Uniqueness of Adjoints: ⁸Consider the diagram (if you *really* want to consider it I fear you will need to zoom in)

In this diagram:

internal adjunctions.

⁷Reference: [JY21, Exercise 6.6.2].

⁸Reference: [JY21, Lemma 6.1.6].

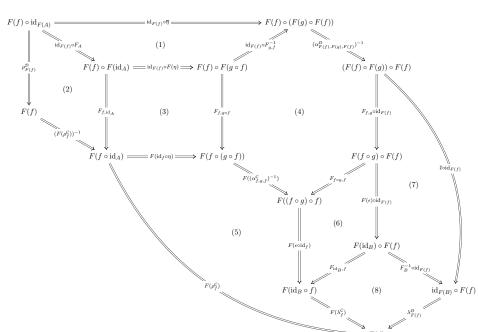

- 1. The morphisms in green are the composition $g \stackrel{\cong}{\Longrightarrow} g' \stackrel{\cong}{\Longrightarrow} g$;
- 2. The morphisms in red are equal to λ_g^C by the right triangle identity for (f, g, η, ϵ) . Hence the composition of the morphism in blue with the morphisms in red is the identity;
- 3. Subdiagrams (1), (2), (10), (11), (29), (31), and (43) commute by the naturality of the left unitor of C and its inverse;
- 4. Subdiagrams (8), (19), and (21) commute by the naturality of the right unitor of C and its inverse;
- 5. Subdiagrams (6), (13), (17), (18), (20), (22), (32), (33), (36), (38), (40), (41), and (45) commute by the naturality of the associator of C and its inverse;
- 6. Subdiagrams (37), (39), and (42) commute by the pentagon identity for C;
- 7. Subdiagrams (3), (4), (7), (12), (25), (30), and (48) commute by Bicategories, ?? of ??;
- 8. Subdiagrams (5), (14), (23), (24), (34), and (35) commute by middle-four exchange;
- 9. Subdiagrams (9), (15), (16), (27), (28), (44), (46), (49), and (50) commute trivially;
- 10. Subdiagram (26) commutes by Bicategories, ???? of ??;
- 11. Subdiagram (47) commutes by Bicategories, ?? of ?? and the naturality of the left unitor of right unitor of C.

Hence $g \cong g'$.

Item 3, Carrying Internal Adjunctions Through Pseudofunctors: ⁹We claim that the left and right triangle identities for $(F(f), F(q), \overline{\eta}, \overline{\epsilon})$ hold:

1. The left triangle identity for $(F(f), F(g), \overline{\eta}, \overline{\epsilon})$ is the condition that the

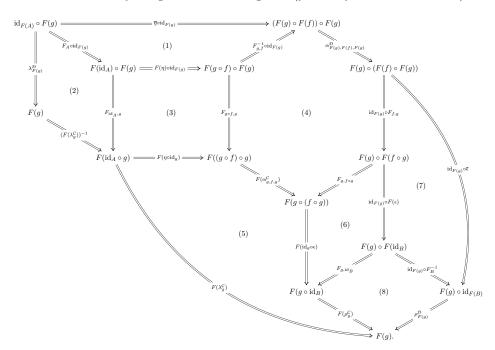

⁹Reference: [JY21, Proposition 6.1.7].

boundary diagram of the diagram (you may need to zoom in)

commutes. Since

- (a) Subdiagrams (1) and (7) commute by applying middle-four exchange twice,
- (b) Subdiagrams (2) and (8) commute by the left and right lax unity conditions for F,
- (c) Subdiagrams (3) and (6) commute by the naturality of the lax functoriality constraints of F,
- (d) Subdiagram (4) commutes by the lax associativity condition for F, and
- (e) Subdiagram (5) commutes by the left triangle identity for (f, g, η, ϵ) , so does the boundary diagram.
- 2. The right triangle identity for $(F(f), F(g), \overline{\eta}, \overline{\epsilon})$ is the condition that

the boundary diagram of the diagram (you may need to zoom in)

commutes. Since

- (a) Subdiagrams (1) and (7) commute by applying middle-four exchange twice,
- (b) Subdiagrams (2) and (8) commute by the left and right lax unity conditions for F,
- (c) Subdiagrams (3) and (6) commute by the naturality of the lax functoriality constraints of F,
- (d) Subdiagram (4) commutes by the lax associativity condition for F, and
- (e) Subdiagram (5) commutes by the right triangle identity for (f, g, η, ϵ) , so does the boundary diagram.

This finishes the proof.

1.3 Internal Adjoint Equivalences

Let C be a bicategory.

Definition 1.3.1.1. An internal adjunction (f, g, η, ϵ) in C is an **internal** adjoint equivalence if η and ϵ are isomorphisms in C.

Example 1.3.1.2. Here are some examples of internal adjoint equivalences.

- 1. Internal Adjoint Equivalences in Cats₂. The internal adjoint equivalences in the 2-category Cats₂ of categories, functors, and natural transformations are precisely the adjoint equivalences of Categories, ??.¹⁰
- 2. Internal Adjoint Equivalences in Mod. The internal adjoint equivalences in Mod are precisely the invertible R-modules; see ??.¹¹
- 3. Internal Adjoint Equivalences in PseudoFun(\mathcal{C}, \mathcal{D}). The internal adjoint equivalences in PseudoFun(\mathcal{C}, \mathcal{D}) are precisely the invertible strong transformations; see ??.¹²
- 4. Internal Adjoint Equivalences in **Rel**. The internal adjoint equivalences in **Rel** are precisely the relations of the form $Gr(f) \dashv f^{-1}$ with f an isomorphism; see ??.
- 5. Internal Adjoint Equivalences in Span. The internal adjoint equivalences in Span are precisely the spans of the form $A \stackrel{\phi}{\leftarrow} S \stackrel{\psi}{\rightarrow} B$ with ϕ and ψ isomorphisms; see ??.

Proposition 1.3.1.3. Let C be a bicategory.

1. Carrying Internal Adjoint Equivalences Through Pseudofunctors. Let $F: \mathcal{C} \longrightarrow \mathcal{D}$ be a pseudofunctor and (f, g, η, ϵ) be an internal adjunction in \mathcal{C} . If (f, g, η, ϵ) is an internal adjoint equivalence in \mathcal{C} , then the induced internal adjunction

$$(F(f), F(g), \overline{\eta}, \overline{\epsilon})$$

in \mathcal{D} of Item 3 of Proposition 1.2.1.4 is an internal adjoint equivalence as well.

2. Internal Adjunctions Always Refine to Internal Adjoint Equivalences. Let (f, g, η, ϵ) be an internal adjunction in C. If f is an equivalence,

¹⁰Reference: [JY21, Examples 6.2.5].

¹¹Reference: [JY21, Examples 6.2.6].

¹²Reference: [JY21, Examples 6.2.7].

1.4 Mates 12

then there exist 2-morphisms

$$\overline{\eta} \colon \mathrm{id}_A \Longrightarrow g \circ f$$
 $\overline{\epsilon} \colon f \circ g \Longrightarrow \mathrm{id}_B$

of C such that $(f, g, \overline{\eta}, \overline{\epsilon})$ is an internal adjoint equivalence.

Proof. <u>Item</u> 1, Carrying Internal Adjoint Equivalences Through Pseudofunctors: See [JY21, Proposition 6.2.3].

Item 2, Internal Adjunctions Always Refine to Internal Adjoint Equivalences: See [JY21, Proposition 6.2.4]. □

1.4 Mates

Let C be a bicategory, let (f, g, η, ϵ) and $(f', g', \eta', \epsilon')$ be adjunctions, and let h and k be morphisms of C as in the diagram

$$\begin{array}{c|c}
A & \xrightarrow{f} & B \\
\downarrow h & & \downarrow k \\
C & \xrightarrow{g'} & D.
\end{array}$$

Definition 1.4.1.1. The mates of a pair of 2-morphisms

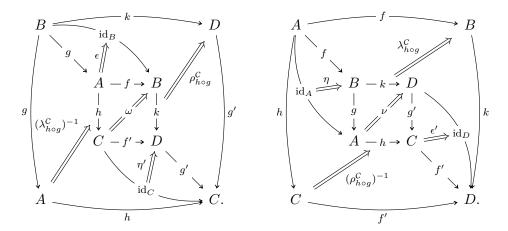

$$\begin{array}{c|c} A \stackrel{f}{\longrightarrow} B \\ \downarrow & \nearrow & \downarrow k \\ C \stackrel{f}{\longrightarrow} D \end{array} \qquad \begin{array}{c} \omega \colon f' \circ h \Longrightarrow k \circ f, \\ \nu \colon h \circ g \Longrightarrow g' \circ k \end{array} \qquad \begin{array}{c} A \stackrel{g}{\longleftarrow} B \\ \downarrow & \searrow & \downarrow k \\ C \stackrel{f}{\longleftarrow} D \end{array}$$

are the 2-morphisms

$$\begin{array}{c|c} A \xleftarrow{g} B & & A \xrightarrow{f} B \\ \downarrow & \downarrow & \downarrow k & \omega^{\dagger} \colon h \circ g \Longrightarrow g' \circ k, & \downarrow & \nearrow \downarrow k \\ C \xleftarrow{g'} D & & \downarrow c & \downarrow c & \downarrow c & \downarrow c \\ \end{array}$$

1.4 Mates 13

defined as the pastings of the diagrams¹³

Proposition 1.4.1.2. Let $\omega \colon f' \circ h \Longrightarrow k \circ f$ and $\nu \colon h \circ g \Longrightarrow g' \circ k$ be 2-morphisms.

1. The Mate Correspondence. The map

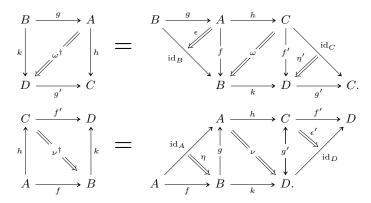

$$(-)^{\dagger} \colon \mathrm{Hom}_{\mathsf{Hom}_{\mathcal{C}}(A,C)}(f' \circ h, k \circ f) \longrightarrow \mathrm{Hom}_{\mathsf{Hom}_{\mathcal{C}}(B,D)}(h \circ g, g' \circ k)$$

$$\omega \longmapsto \omega^{\dagger}$$

is a bijection.

Proof. Item 1, The Mate Correspondence: Here we give a proof for 2-categories (which indirectly proves also the general case by Bicategories, ??). A proof for general bicategories can be found in [JY21, Lemma 6.1.13].

 $^{^{13}}$ If C is a 2-category, these pasting diagrams become the following:

1.4 Mates 14

Let

$$\nu \colon h \circ g \Longrightarrow g' \circ k \qquad A \xleftarrow{g} B$$

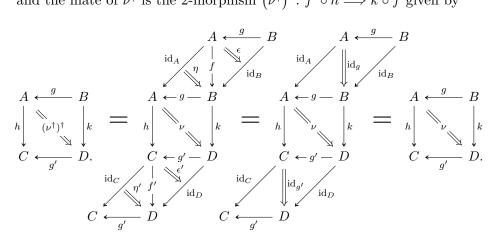

$$\downarrow h \qquad \downarrow k$$

$$C \xleftarrow{g'} D$$

be a 2-morphism of C. The mate ν^{\dagger} of ν is then given by

$$\begin{array}{cccc}
A & \xrightarrow{f} & B \\
\downarrow & & \downarrow & \downarrow \\
A & \xrightarrow{\eta} & \downarrow f \\
A & \leftarrow g - B \\
\downarrow & & \downarrow & \downarrow \\
C & \xrightarrow{f'} & D & C & \leftarrow g' - D \\
\downarrow & & \downarrow & \downarrow \\
C & \leftarrow g' - D \\
\downarrow & & \downarrow & \downarrow \\
D, & & \downarrow & \downarrow \\
\end{array}$$

and the mate of ν^{\dagger} is the 2-morphism $(\nu^{\dagger})^{\dagger} \colon f' \circ h \Longrightarrow k \circ f$ given by

Similarly, $(\omega)^{\dagger^{\dagger}} = \omega$.

2 Morphisms of Internal Adjunctions

2.1 Lax Morphisms of Internal Adjunctions

Let C be a bicategory and let $(A, B, F, G, \eta, \epsilon)$ and $(A', B', F', G', \eta', \epsilon')$ be internal adjunctions in C.

Definition 2.1.1.1. A lax morphism of internal adjunctions from $(A, B, F, G, \eta, \epsilon)$ to $(A', B', F', G', \eta', \epsilon')$ is a lax transformation between these viewed as 2-functors from the walking adjunction.

Remark 2.1.1.2. In detail, a lax morphism of internal adjunctions from $(A, B, F, G, \eta, \epsilon)$ to $(A', B', F', G', \eta', \epsilon')$ consists of

• 1-Morphisms. A pair of 1-morphisms

$$\phi \colon A \to A',$$
$$\psi \colon B \to B'$$

of C;

of C;

• 2-Morphisms. A pair of 2-morphisms

$$A \xrightarrow{F} B$$

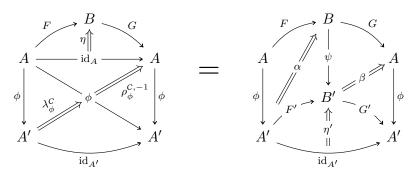

$$\downarrow \phi \qquad \downarrow \psi \qquad \alpha : F' \circ \phi \Rightarrow \psi \circ F, \qquad \downarrow \phi \qquad \downarrow \psi$$

$$A' \xrightarrow{F'} B' \qquad A' \xleftarrow{G} B$$

$$\downarrow \phi \qquad \downarrow \psi \qquad$$

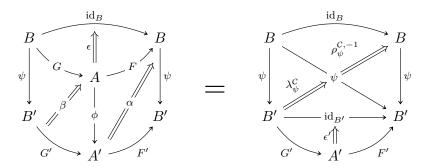

satisfying the following conditions:

1. Compatibility With Units. We have an equality

of pasting diagrams in C;

2. Compatibility With Counits. We have an equality

of pasting diagrams in C.

2.2 Oplax Morphisms of Internal Adjunctions

Let C be a bicategory and let $(A, B, F, G, \eta, \epsilon)$ and $(A', B', F', G', \eta', \epsilon')$ be internal adjunctions in C.

Definition 2.2.1.1. An oplax morphism of internal adjunctions from $(A, B, F, G, \eta, \epsilon)$ to $(A', B', F', G', \eta', \epsilon')$ is an oplax transformation between these viewed as 2-functors from the walking adjunction.

Remark 2.2.1.2. In detail, an oplax morphism of internal adjunctions from $(A, B, F, G, \eta, \epsilon)$ to $(A', B', F', G', \eta', \epsilon')$ consists of

• 1-Morphisms. A pair of 1-morphisms

$$\phi \colon A \to A',$$

$$\psi \colon B \to B'$$

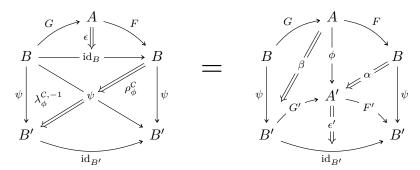

of C;

• 2-Morphisms. A pair of 2-morphisms

of C;

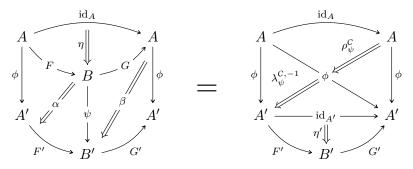

satisfying the following conditions:

1. Compatibility With Units. We have an equality

of pasting diagrams in C;

2. Compatibility With Counits. We have an equality

of pasting diagrams in C.

2.3 Strong Morphisms of Internal Adjunctions

Let C be a bicategory and let $(A, B, F, G, \eta, \epsilon)$ and $(A', B', F', G', \eta', \epsilon')$ be internal adjunctions in C.

Definition 2.3.1.1. A strong morphism of internal adjunctions from $(A, B, F, G, \eta, \epsilon)$ to $(A', B', F', G', \eta', \epsilon')$ is a strong transformation between these viewed as 2-functors from the walking adjunction.

Remark 2.3.1.2. In detail, a strong morphism of internal adjunctions from $(A, B, F, G, \eta, \epsilon)$ to $(A', B', F', G', \eta', \epsilon')$ is equivalently:

- 1. A lax morphism of internal adjunctions as in Remark 2.1.1.2 whose 2-morphisms are invertible.
- 2. An oplax morphism of internal adjunctions as in Remark 2.2.1.2 whose 2-morphisms are invertible.

2.4 Strict Morphisms of Internal Adjunctions

Let C be a bicategory and let $(A, B, F, G, \eta, \epsilon)$ and $(A', B', F', G', \eta', \epsilon')$ be internal adjunctions in C.

Definition 2.4.1.1. A strict morphism of internal adjunctions from $(A, B, F, G, \eta, \epsilon)$ to $(A', B', F', G', \eta', \epsilon')$ is a strict transformation between these viewed as 2-functors from the walking adjunction.

Remark 2.4.1.2. In detail, a strict morphism of internal adjunctions from $(A, B, F, G, \eta, \epsilon)$ to $(A', B', F', G', \eta', \epsilon')$ is equivalently:

- 1. A lax morphism of internal adjunctions as in Remark 2.1.1.2 whose 2-morphisms are identities.
- 2. An oplax morphism of internal adjunctions as in Remark 2.2.1.2 whose 2-morphisms are identities.

3 2-Morphisms Between Morphisms of Internal Adjunctions

3.1 2-Morphisms Between Lax Morphisms of Internal Adjunctions

Let C be a bicategory, let $(A, B, F, G, \eta, \epsilon)$ and $(A', B', F', G', \eta', \epsilon')$ be internal adjunctions in C, and let $(\phi_1, \psi_1, \alpha_1, \beta_1)$ and $(\phi_2, \psi_2, \alpha_2, \beta_2)$ be lax morphisms of internal adjunctions from $(A, B, F, G, \eta, \epsilon)$ to $(A', B', F', G', \eta', \epsilon')$.

Definition 3.1.1.1. A **2-morphism from** $(\phi_1, \psi_1, \alpha_1, \beta_1)$ **to** $(\phi_2, \psi_2, \alpha_2, \beta_2)$ is a modification between these viewed as lax transformations.

Remark 3.1.1.2. In detail, a 2-morphism from $(\phi_1, \psi_1, \alpha_1, \beta_1)$ to $(\phi_2, \psi_2, \alpha_2, \beta_2)$ consist of 2-morphisms

$$\Gamma \colon \phi_1 \Rightarrow \phi_2$$

$$\Sigma \colon \psi_1 \Rightarrow \psi_2$$

of C such that we have equalities

of pasting diagrams in C.

3.2 2-Morphisms Between Oplax Morphisms of Internal Adjunctions

Let C be a bicategory, let $(A, B, F, G, \eta, \epsilon)$ and $(A', B', F', G', \eta', \epsilon')$ be internal adjunctions in C, and let $(\phi_1, \psi_1, \alpha_1, \beta_1)$ and $(\phi_2, \psi_2, \alpha_2, \beta_2)$ be oplax morphisms of internal adjunctions from $(A, B, F, G, \eta, \epsilon)$ to $(A', B', F', G', \eta', \epsilon')$.

Definition 3.2.1.1. A **2-morphism from** $(\phi_1, \psi_1, \alpha_1, \beta_1)$ **to** $(\phi_2, \psi_2, \alpha_2, \beta_2)$ is a modification between these viewed as oplax transformations.

Remark 3.2.1.2. In detail, a 2-morphism from $(\phi_1, \psi_1, \alpha_1, \beta_1)$ to $(\phi_2, \psi_2, \alpha_2, \beta_2)$ consist of 2-morphisms

$$\Gamma \colon \phi_1 \Rightarrow \phi_2$$

$$\Sigma \colon \psi_1 \Rightarrow \psi_2$$

of C such that we have equalities

of pasting diagrams in C.

3.3 2-Morphisms Between Strong Morphisms of Internal Adjunctions

Let C be a bicategory, let $(A, B, F, G, \eta, \epsilon)$ and $(A', B', F', G', \eta', \epsilon')$ be internal adjunctions in C, and let $(\phi_1, \psi_1, \alpha_1, \beta_1)$ and $(\phi_2, \psi_2, \alpha_2, \beta_2)$ be strong morphisms of internal adjunctions from $(A, B, F, G, \eta, \epsilon)$ to $(A', B', F', G', \eta', \epsilon')$.

Definition 3.3.1.1. A **2-morphism from** $(\phi_1, \psi_1, \alpha_1, \beta_1)$ **to** $(\phi_2, \psi_2, \alpha_2, \beta_2)$ is a modification between these viewed as strong transformations.

Remark 3.3.1.2. In detail, a 2-morphism from $(\phi_1, \psi_1, \alpha_1, \beta_1)$ to $(\phi_2, \psi_2, \alpha_2, \beta_2)$ is equivalently:

- A 2-morphism (Γ, Σ) from $(\phi_1, \psi_1, \alpha_1, \beta_1)$ to $(\phi_2, \psi_2, \alpha_2, \beta_2)$ viewed as lax transformations as in Remark 3.1.1.2.
- A 2-morphism (Γ, Σ) from $(\phi_1, \psi_1, \alpha_1, \beta_1)$ to $(\phi_2, \psi_2, \alpha_2, \beta_2)$ viewed as oplax transformations as in Remark 3.2.1.2.

3.4 2-Morphisms Between Strict Morphisms of Internal Adjunctions

Let C be a bicategory, let $(A, B, F, G, \eta, \epsilon)$ and $(A', B', F', G', \eta', \epsilon')$ be internal adjunctions in C, and let $(\phi_1, \psi_1, \alpha_1, \beta_1)$ and $(\phi_2, \psi_2, \alpha_2, \beta_2)$ be lax morphisms of internal adjunctions from $(A, B, F, G, \eta, \epsilon)$ to $(A', B', F', G', \eta', \epsilon')$.

Definition 3.4.1.1. A **2-morphism from** $(\phi_1, \psi_1, \alpha_1, \beta_1)$ **to** $(\phi_2, \psi_2, \alpha_2, \beta_2)$ is a modification between these viewed as strict transformations.

Remark 3.4.1.2. In detail, a 2-morphism from $(\phi_1, \psi_1, \alpha_1, \beta_1)$ to $(\phi_2, \psi_2, \alpha_2, \beta_2)$ is equivalently:

- A 2-morphism (Γ, Σ) from $(\phi_1, \psi_1, \alpha_1, \beta_1)$ to $(\phi_2, \psi_2, \alpha_2, \beta_2)$ viewed as lax transformations as in Remark 3.1.1.2.
- A 2-morphism (Γ, Σ) from $(\phi_1, \psi_1, \alpha_1, \beta_1)$ to $(\phi_2, \psi_2, \alpha_2, \beta_2)$ viewed as oplax transformations as in Remark 3.2.1.2.
- A 2-morphism (Γ, Σ) from $(\phi_1, \psi_1, \alpha_1, \beta_1)$ to $(\phi_2, \psi_2, \alpha_2, \beta_2)$ viewed as strong transformations as in Remark 3.3.1.2.
