00SR ## 1.1   The Walking Adjunction

00SS

> **DEFINITION 1.1.1 ▶ THE WALKING ADJUNCTION**
>
> The **walking adjunction** is the bicategory Adj freely generated by[1]
>
> · *Objects.* A pair of objects A and B;
>
> · *Morphisms.* A pair of morphisms
>
> $$L \colon A \to B,$$
> $$R \colon B \to A;$$
>
> · *2-Morphisms.* A pair of 2-morphisms
>
> $$\eta \colon \mathrm{id}_A \to L \circ R,$$
> $$\epsilon \colon R \circ L \to \mathrm{id}_B;$$

subject to the equalities

of pasting diagrams, which are equivalent to the following conditions:

1. *The Left Triangle Identity.* The diagram

$$L \circ \mathsf{id}_A \xRightarrow{\mathsf{id}_L \circ \eta} L \circ (R \circ L) \xRightarrow{(\alpha_{L,R,L}^{\mathsf{Adj}})^{-1}} (L \circ R) \circ L$$

with ρ_L^{Adj}, $\epsilon \circ \mathsf{id}_L$, $\mathsf{id}_B \circ L$, λ_L^{Adj}, L

commutes.

2. *The Right Triangle Identity.* The diagram

$$\mathrm{id}_A \circ R \xrightarrow{\;\eta\circ\mathrm{id}_R\;} (R \circ L) \circ R \xrightarrow{\;\alpha^{\mathrm{Adj}}_{R,L,R}\;} R \circ (L \circ R)$$

with the diagonal morphism λ^{Adj}_R to R, the vertical morphism $\mathrm{id}_R\circ\epsilon$ to $R \circ \mathrm{id}_B$, and ρ^{Adj}_R to $R.$

---

[1]See [SS86] for an explicit description of the 2-category (as opposed to a bicategory) version of Adj in terms of finite ordinals, similar to the description of the 2-category version of the walking monad (??) as a subcategory of Δ.

00ST ## 1.2   Internal Adjunctions

Let C be a bicategory.

00SU
DEFINITION 1.2.1 ▶ INTERNAL ADJUNCTIONS

An **internal adjunction in** $C^{[1,2]}$ is a 2-functor Adj $\to C$.

---

[1]*Further Terminology:* Also called an **adjunction internal to** C.
[2]*Further Terminology:* In this situation, we also call (g,f) an **adjoint pair**, f the **left adjoint** of the pair, g the **right adjoint** of the pair, η the **unit** of the adjunction, and ϵ the **counit** of the adjunction.

00SV
REMARK 1.2.2 ▶ UNWINDING DEFINITION 1.2.1

In detail, an **internal adjunction in** C consists of

· *Objects.* A pair of objects A and B of C;

· *Morphisms.* A pair of morphisms
$$L\colon A \to B,$$
$$R\colon B \to A$$

of C;

· *2-Morphisms.* A pair of 2-morphisms

$$\eta : \mathrm{id}_A \to L \circ R,$$
$$\epsilon : R \circ L \to \mathrm{id}_B$$

of C;

subject to the equalities

of pasting diagrams in C, which are equivalent to the following conditions:[1]

1. *The Left Triangle Identity.* The diagram

commutes.

2. *The Right Triangle Identity.* The diagram

$$\mathrm{id}_A \circ R \xRightarrow{\eta \circ \mathrm{id}_R} (R \circ L) \circ R \xRightarrow{\alpha^C_{R,L,R}} R \circ (L \circ R)$$

with λ^C_R the diagonal to R, $\mathrm{id}_R \circ \epsilon$ down to $R \circ \mathrm{id}_B$, and ρ^C_R to $R.$

¹When C is a 2-category, these diagrams take the following form:

$$L \xRightarrow{\mathrm{id}_L \circ \eta} L \circ R \circ L \qquad R \xRightarrow{\mathrm{id}_R \circ \eta} R \circ L \circ R$$

with id_L diagonal and $\epsilon \circ \mathrm{id}_L$ down to L; and id_L diagonal and $\epsilon \circ \mathrm{id}_R$ down to $R.$

EXAMPLE 1.2.3 ▶ EXAMPLES OF INTERNAL ADJUNCTIONS

Here are some examples of internal adjunctions.

00SX
1. *Internal Adjunctions in* Cats_2. The internal adjunctions in the 2-category Cats_2 of categories, functors, and natural transformations are precisely the adjunctions of Categories, **??**.

00SY
2. *Internal Adjunctions in* **Rel**. The internal adjunctions in **Rel** are precisely the relations of the form $\mathrm{Gr}(f) \dashv f^{-1}$ with f a function; see Relations, Item 4 of Proposition 2.5.1.

00SZ
3. *Internal Adjunctions in* Span. The internal adjunctions in Span are precisely the spans of the form

$$\begin{array}{ccc} & S & \\ {}^{\phi}\swarrow & & \searrow^{g} \\ A & & B \end{array}$$

with ϕ an isomorphism; see Spans, Item 4 of Proposition 2.5.1.

00T0 **PROPOSITION 1.2.4 ▶ PROPERTIES OF INTERNAL ADJUNCTIONS**

Let C be a bicategory.

00T1   1. *Duality.* Let (f, g, η, ϵ) be an internal adjunction in C.

(a) The quadruple (g, f, η, ϵ) is an internal adjunction in C^{op}.

(b) The quadruple (g, f, ϵ, η) is an internal adjunction in C^{co}.

(c) The quadruple (f, g, η, ϵ) is an internal adjunction in C^{coop}.

00T2   2. *Uniqueness of Adjoints.* Let (f, g, η, ϵ) and $(f, g', \eta', \epsilon')$ be internal adjunctions in C. We have a canonical isomorphism[1]

$$g \xrightarrow{(\lambda_g^C)^{-1}} \mathrm{id}_A \circ g \xrightarrow{\eta' \circ \mathrm{id}_g} (g' \circ f) \circ g \xrightarrow{\alpha_{g',f,g}^C} g' \circ (f \circ g) \xrightarrow{\mathrm{id}_{g'} \circ \epsilon} g' \circ \mathrm{id}_B \xrightarrow{(\rho_{g'}^C)^{-1}} g'$$

with inverse

$$g' \xrightarrow{(\lambda_{g'}^C)^{-1}} \mathrm{id}_B \circ g' \xrightarrow{\eta \circ \mathrm{id}_{g'}} (g \circ f) \circ g' \xrightarrow{\alpha_{g',f,g}^C} g \circ (f \circ g') \xrightarrow{\mathrm{id}_g \circ \epsilon'} g \circ \mathrm{id}_B \xrightarrow{(\lambda_g^C)^{-1}} g.$$

00T3   3. *Carrying Internal Adjunctions Through Pseudofunctors.* Let $F \colon C \longrightarrow D$ be a pseudofunctor and (f, g, η, ϵ) be an internal adjunction in C. There is an induced internal adjunction[2]

$$(F(f), F(g), \overline{\eta}, \overline{\epsilon})$$

in D, where:

(a) The unit
$$\overline{\eta} \colon \mathrm{id}_{F(A)} \Longrightarrow F(g) \circ F(f)$$
is the composition

$$\mathrm{id}_{F(A)} \xrightarrow{F_A} F(\mathrm{id}_A) \xrightarrow{F(\eta)} F(g \circ f) \xrightarrow{F_{g,f}^{-1}} F(g) \circ F(f).$$

(b) The counit

$$\bar{\epsilon}: F(f) \circ F(g) \Longrightarrow \text{id}_{F(B)}$$

is the composition

$$F(f) \circ F(g) \xRightarrow{F_{f,g}} F(f \circ g) \xRightarrow{F(\epsilon)} F(\text{id}_B) \xRightarrow{F_B} \text{id}_{F(B)}.$$

---

[1] *Slogan:* Left adjoints are unique up to canonical isomorphism. Dually, so are right adjoints.

[2] *Warning:* Lax or oplax functors which are not pseudofunctors need not preserve internal adjunctions.
PROOF 1.2.5 ▶ PROOF OF PROPOSITION 1.2.4

Item 1: Duality

Omitted.[1]

Item 2: Uniqueness of Adjoints

[2]Consider the diagram (if you *really* want to consider it I fear you will need to zoom in)

In this diagram:

1. The morphisms in green are the composition $g \xrightarrow{\cong} g' \xrightarrow{\cong} g$;

2. The morphisms in red are equal to λ_g^C by the right triangle identity for (f, g, η, ϵ). Hence the composition of the morphism in blue with the morphisms in red is the identity;

3. Subdiagrams (1), (2), (10), (11), (29), (31), and (43) commute by the naturality of the left unitor of C and its inverse;

4. Subdiagrams (8), (19), and (21) commute by the naturality of the right unitor of C and its inverse;

5. Subdiagrams (6), (13), (17), (18), (20), (22), (32), (33), (36), (38), (40), (41), and (45) commute by the naturality of the associator of C and its inverse;

6. Subdiagrams (37), (39), and (42) commute by the pentagon identity for C;

7. Subdiagrams (3), (4), (7), (12), (25), (30), and (48) commute by Bicategories, ?? of ??;

8. Subdiagrams (5), (14), (23), (24), (34), and (35) commute by middle-four exchange;

9. Subdiagrams (9), (15), (16), (27), (28), (44), (46), (49), and (50) commute trivially;

10. Subdiagram (26) commutes by Bicategories, ???? of ??;

11. Subdiagram (47) commutes by Bicategories, ?? of ?? and the naturality of the left unitor of right unitor of C.
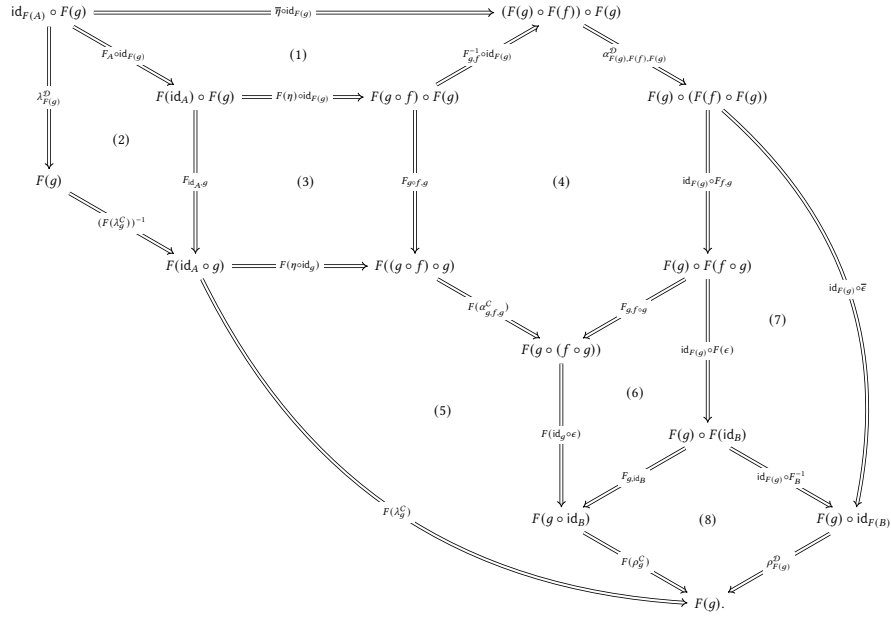

Hence $g \cong g'$.

Item 3: Carrying Internal Adjunctions Through Pseudofunctors

[3]We claim that the left and right triangle identities for $(F(f), F(g), \overline{\eta}, \overline{\epsilon})$ hold:

1. The left triangle identity for $(F(f), F(g), \overline{\eta}, \overline{\epsilon})$ is the condition that the
boundary diagram of the diagram (you may need to zoom in)

commutes. Since

(a) Subdiagrams (1) and (7) commute by applying middle-four exchange twice,

(b) Subdiagrams (2) and (8) commute by the left and right lax unity conditions for F,

(c) Subdiagrams (3) and (6) commute by the naturality of the lax functoriality constraints of F,

(d) Subdiagram (4) commutes by the lax associativity condition for F, and

(e) Subdiagram (5) commutes by the left triangle identity for (f, g, η, ϵ),

so does the boundary diagram.

2. The right triangle identity for $(F(f), F(g), \overline{\eta}, \overline{\epsilon})$ is the condition that the

boundary diagram of the diagram (you may need to zoom in)

commutes. Since

(a) Subdiagrams (1) and (7) commute by applying middle-four exchange twice,

(b) Subdiagrams (2) and (8) commute by the left and right lax unity conditions for F,

(c) Subdiagrams (3) and (6) commute by the naturality of the lax functoriality constraints of F,

(d) Subdiagram (4) commutes by the lax associativity condition for F, and

(e) Subdiagram (5) commutes by the right triangle identity for (f, g, η, ϵ),

so does the boundary diagram.

This finishes the proof.

---

00T4 **1.3   Internal Adjoint Equivalences**

Let C be a bicategory.

00T5 **DEFINITION 1.3.1 ▶ INTERNAL ADJOINT EQUIVALENCES**

An internal adjunction (f, g, η, ϵ) in C is an **internal adjoint equivalence** if η and ϵ are isomorphisms in C.

00T6 **EXAMPLE 1.3.2 ▶ EXAMPLES OF INTERNAL ADJOINT EQUIVALENCES**

Here are some examples of internal adjoint equivalences.

00T7 1. *Internal Adjoint Equivalences in* Cats_2. The internal adjoint equivalences in the 2-category Cats_2 of categories, functors, and natural transformations are precisely the adjoint equivalences of Categories, **??**.[1]

00T8 2. *Internal Adjoint Equivalences in* Mod. The internal adjoint equivalences in Mod are precisely the invertible R-modules; see **??**.[2]

00T9 3. *Internal Adjoint Equivalences in* $\mathsf{PseudoFun}\big(C, \mathcal{D}\big)$. The internal adjoint equivalences in $\mathsf{PseudoFun}(C, \mathcal{D})$ are precisely the invertible strong transformations; see **??**.[3]

00TA 4. *Internal Adjoint Equivalences in* **Rel**. The internal adjoint equivalences in **Rel** are precisely the relations of the form $\mathrm{Gr}(f) \dashv f^{-1}$ with f an isomorphism; see **??**.

00TB 5. *Internal Adjoint Equivalences in* Span. The internal adjoint equivalences in Span are precisely the spans of the form $A \xleftarrow{\phi} S \xrightarrow{\psi} B$ with ϕ and ψ isomorphisms; see **??**.

[1] Reference: [JY21], Examples 6.2.5].
[3] Reference: [JY21], Examples 6.2.7].

00TC **PROPOSITION 1.3.3 ▶ PROPERTIES OF INTERNAL ADJOINT EQUIVALENCES**

Let C be a bicategory.

00TD 1. *Carrying Internal Adjoint Equivalences Through Pseudofunctors.* Let $F\colon C \longrightarrow \mathcal{D}$ be a pseudofunctor and (f, g, η, ϵ) be an internal adjunction in C. If

(f, g, η, ϵ) is an internal adjoint equivalence in C, then the induced internal adjunction

$$(F(f), F(g), \overline{\eta}, \overline{\epsilon})$$

in $\mathcal{D}$ of Item 3 of Proposition 1.2.4 is an internal adjoint equivalence as well.

00TE

2. *Internal Adjunctions Always Refine to Internal Adjoint Equivalences.*   Let (f, g, η, ϵ) be an internal adjunction in C. If f is an equivalence, then there exist 2-morphisms

$$\overline{\eta}\colon \operatorname{id}_A \Longrightarrow g \circ f$$
$$\overline{\epsilon}\colon f \circ g \Longrightarrow \operatorname{id}_B$$

of C such that $(f, g, \overline{\eta}, \overline{\epsilon})$ is an internal adjoint equivalence.

PROOF 1.3.4 ▶ PROOF OF PROPOSITION 1.3.3

Item 1: Carrying Internal Adjoint Equivalences Through Pseudofunctors
See [JY21, Proposition 6.2.3].

Item 2: Internal Adjunctions Always Refine to Internal Adjoint Equivalences

See [JY21, Proposition 6.2.4].

00TF **1.4   Mates**

Let C be a bicategory, let (f, g, η, ϵ) and $(f', g', \eta', \epsilon')$ be adjunctions, and let h and k be morphisms of C as in the diagram
00TG

DEFINITION 1.4.1 ▶ MATES

The **mates** of a pair of 2-morphisms

$$A \xrightarrow{f} B$$

$$\omega: f' \circ h \Longrightarrow k \circ f,$$
$$v: h \circ g \Longrightarrow g' \circ k$$

are the 2-morphisms

$$\omega^\dagger: h \circ g \Longrightarrow g' \circ k,$$
$$v^\dagger: f' \circ h \Longrightarrow k \circ f$$

defined as the pastings of the diagrams[1]

---

[1]If C is a 2-category, these pasting diagrams become the following:

00TH | **PROPOSITION 1.4.2 ▶ PROPERTIES OF MATES**

Let $\omega\colon f' \circ h \Longrightarrow k \circ f$ and $v\colon h \circ g \Longrightarrow g' \circ k$ be 2-morphisms.

00TJ | 1. *The Mate Correspondence.* The map

$$(-)^{\dagger}\colon \mathrm{Hom}_{\mathrm{Hom}_C(A,C)}(f' \circ h, k \circ f) \longrightarrow \mathrm{Hom}_{\mathrm{Hom}_C(B,D)}(h \circ g, g' \circ k)$$

$$\omega \longmapsto \omega^{\dagger}$$
is a bijection.

PROOF 1.4.3 ▶ PROOF OF PROPOSITION 1.4.2
Item 1: The Mate Correspondence

Here we give a proof for 2-categories (which indirectly proves also the general case by Bicategories, **??**). A proof for general bicategories can be found in [JY21, Lemma 6.1.13].
Let

$$\nu : h \circ g \implies g' \circ k$$

$$
\begin{array}{ccc}
A & \xleftarrow{\;g\;} & B \\
h \downarrow & \overset{\nu}{\Rightarrow} & \downarrow k \\
C & \xleftarrow{\;g'\;} & D
\end{array}
$$

be a 2-morphism of C. The mate $\nu^\dagger$ of ν is then given by

$$
\begin{array}{ccc}
A & \xrightarrow{\;f\;} & B \\
h \downarrow & \overset{\nu^\dagger}{\Rightarrow} & \downarrow k \\
C & \xrightarrow{\;f'\;} & D
\end{array}
\quad = \quad
\begin{array}{c}
A \\
\overset{\mathrm{id}_A}{\nearrow} \quad \overset{\eta}{\Rightarrow} \quad \downarrow f \\
A \xleftarrow{\;g\;} B \\
h \downarrow \quad \overset{\nu}{\Rightarrow} \quad \downarrow k \\
C \xleftarrow{\;g'\;} D \\
f' \downarrow \quad \overset{\epsilon'}{\Rightarrow} \quad \nearrow \mathrm{id}_D \\
D,
\end{array}
$$

and the mate of $\nu^\dagger$ is the 2-morphism $\left(\nu^\dagger\right)^\dagger : f' \circ h \implies k \circ f$ given by

$$
\begin{array}{ccc}
A & \xleftarrow{\;g\;} & B \\
h \downarrow & \overset{\left(\nu^\dagger\right)^\dagger}{\Rightarrow} & \downarrow k \\
C & \xleftarrow{\;g'\;} & D.
\end{array}
\; = \;
\begin{array}{c}
\mathrm{id}_A \; \overset{\eta}{\Rightarrow} \; f \\
A \xleftarrow{\;g\;} B \\
h \downarrow \; \overset{\nu}{\Rightarrow} \; \downarrow k \\
C \xleftarrow{\;g'\;} D \\
\mathrm{id}_C \; \overset{\eta'}{\Rightarrow} \; f' \; \overset{\epsilon'}{\Rightarrow} \; \mathrm{id}_D \\
C \xleftarrow{\;g'\;} D
\end{array}
\; = \;
\begin{array}{c}
\mathrm{id}_A \; \overset{\epsilon}{\Rightarrow} \; \mathrm{id}_B \\
A \xleftarrow{\;g\;} B \\
h \downarrow \; \overset{\nu}{\Rightarrow} \; \downarrow k \\
C \xleftarrow{\;g'\;} D \\
\mathrm{id}_C \; \overset{\mathrm{id}_{g'}}{\Rightarrow} \; \mathrm{id}_D
\end{array}
\; = \;
\begin{array}{ccc}
A & \xleftarrow{\;g\;} & B \\
h \downarrow & \overset{\nu}{\Rightarrow} & \downarrow k \\
C & \xleftarrow{\;g'\;} & D.
\end{array}
$$

Similarly, $(\omega)^{\dagger\dagger} = \omega$.

`00TK` ## 2 Morphisms of Internal Adjunctions

`00TL` ### 2.1 Lax Morphisms of Internal Adjunctions

Let C be a bicategory and let $(A, B, F, G, \eta, \epsilon)$ and $(A', B', F', G', \eta', \epsilon')$ be internal adjunctions in C.

`00TM`
> **DEFINITION 2.1.1 ▶ LAX MORPHISMS OF INTERNAL ADJUNCTIONS**
>
> A **lax morphism of internal adjunctions** from $(A, B, F, G, \eta, \epsilon)$ to $(A', B', F', G', \eta', \epsilon')$ is a lax transformation between these viewed as 2-functors from the walking adjunction.

`00TN`
> **REMARK 2.1.2 ▶ UNWINDING DEFINITION 2.1.1**
>
> In detail, a **lax morphism of internal adjunctions** from $(A, B, F, G, \eta, \epsilon)$ to $(A', B', F', G', \eta', \epsilon')$ consists of
>
> · *1-Morphisms.* A pair of 1-morphisms
>
> $$\phi \colon A \to A',$$
> $$\psi \colon B \to B'$$
>
> of C;
>
> · *2-Morphisms.* A pair of 2-morphisms
>
>
>
> $$\alpha \colon F' \circ \phi \Rightarrow \psi \circ F,$$
> $$\beta \colon G' \circ \phi \Rightarrow \psi \circ G$$
>
> of C;
>
> satisfying the following conditions:

1. *Compatibility With Units.* We have an equality

of pasting diagrams in C;

2. *Compatibility With Counits.* We have an equality

of pasting diagrams in C.

2.2   Oplax Morphisms of Internal Adjunctions

Let C be a bicategory and let $(A, B, F, G, \eta, \epsilon)$ and $(A', B', F', G', \eta', \epsilon')$ be internal adjunctions in C.

DEFINITION 2.2.1 ▶ OPLAX MORPHISMS OF INTERNAL ADJUNCTIONS

An **oplax morphism of internal adjunctions** from $(A, B, F, G, \eta, \epsilon)$ to $(A', B', F', G', \eta', \epsilon')$ is an oplax transformation between these viewed as 2-functors from the walking adjunction.

REMARK 2.2.2 ▶ UNWINDING DEFINITION 2.2.1

In detail, an **oplax morphism of internal adjunctions** from $(A, B, F, G, \eta, \epsilon)$ to $(A', B', F', G', \eta', \epsilon')$ consists of

- 1-*Morphisms.* A pair of 1-morphisms

$$\phi \colon A \to A',$$
$$\psi \colon B \to B'$$

  of C;

- 2-*Morphisms.* A pair of 2-morphisms

$$\alpha \colon \psi \circ F \Rightarrow F' \circ \phi,$$
$$\beta \colon \psi \circ G \Rightarrow G' \circ \phi$$

  of C;

satisfying the following conditions:

1. *Compatibility With Units.* We have an equality

  of pasting diagrams in C;

2. *Compatibility With Counits.* We have an equality

of pasting diagrams in C.

2.3   Strong Morphisms of Internal Adjunctions

Let C be a bicategory and let $(A, B, F, G, \eta, \epsilon)$ and $(A', B', F', G', \eta', \epsilon')$ be internal adjunctions in C.

DEFINITION 2.3.1 ▶ STRONG MORPHISMS OF INTERNAL ADJUNCTIONS

A **strong morphism of internal adjunctions** from $(A, B, F, G, \eta, \epsilon)$ to $(A', B', F', G', \eta', \epsilon')$ is a strong transformation between these viewed as 2-functors from the walking adjunction.

REMARK 2.3.2 ▶ UNWINDING DEFINITION 2.3.1

In detail, a **strong morphism of internal adjunctions** from $(A, B, F, G, \eta, \epsilon)$ to $(A', B', F', G', \eta', \epsilon')$ is equivalently:

1. A lax morphism of internal adjunctions as in Remark 2.1.2 whose 2-morphisms are invertible.

2. An oplax morphism of internal adjunctions as in Remark 2.2.2 whose 2-morphisms are invertible.

2.4   Strict Morphisms of Internal Adjunctions

Let C be a bicategory and let $(A, B, F, G, \eta, \epsilon)$ and $(A', B', F', G', \eta', \epsilon')$ be internal adjunctions in C.

00TW

DEFINITION 2.4.1 ▸ STRICT MORPHISMS OF INTERNAL ADJUNCTIONS

A **strict morphism of internal adjunctions** from $(A, B, F, G, \eta, \epsilon)$ to $(A', B', F', G', \eta', \epsilon')$ is a strict transformation between these viewed as 2-functors from the walking adjunction.

00TX

REMARK 2.4.2 ▸ UNWINDING DEFINITION 2.4.1

In detail, a **strict morphism of internal adjunctions** from $(A, B, F, G, \eta, \epsilon)$ to $(A', B', F', G', \eta', \epsilon')$ is equivalently:

1. A lax morphism of internal adjunctions as in Remark 2.1.2 whose 2-morphisms are identities.

2. An oplax morphism of internal adjunctions as in Remark 2.2.2 whose 2-morphisms are identities.

00TY 3   2-Morphisms Between Morphisms of Internal Adjunctions

00TZ 3.1   2-Morphisms Between Lax Morphisms of Internal Adjunctions

Let C be a bicategory, let $(A, B, F, G, \eta, \epsilon)$ and $(A', B', F', G', \eta', \epsilon')$ be internal adjunctions in C, and let $(\phi_1, \psi_1, \alpha_1, \beta_1)$ and $(\phi_2, \psi_2, \alpha_2, \beta_2)$ be lax morphisms of internal adjunctions from $(A, B, F, G, \eta, \epsilon)$ to $(A', B', F', G', \eta', \epsilon')$.

00U0

DEFINITION 3.1.1 ▸ 2-MORPHISMS BETWEEN LAX MORPHISMS OF INTERNAL ADJUNCTIONS

A **2-morphism from** $(\phi_1, \psi_1, \alpha_1, \beta_1)$ **to** $(\phi_2, \psi_2, \alpha_2, \beta_2)$ is a modification between these viewed as lax transformations.

00U1

REMARK 3.1.2 ▸ UNWINDING DEFINITION 3.1.1

In detail, a **2-morphism from** $(\phi_1, \psi_1, \alpha_1, \beta_1)$ **to** $(\phi_2, \psi_2, \alpha_2, \beta_2)$ consist of 2-morphisms

$$\Gamma \colon \phi_1 \Rightarrow \phi_2$$
$$\Sigma \colon \psi_1 \Rightarrow \psi_2$$

of C such that we have equalities

of pasting diagrams in C.

00U2 3.2   2-Morphisms Between Oplax Morphisms of Internal Adjunctions

Let C be a bicategory, let $(A, B, F, G, \eta, \epsilon)$ and $(A', B', F', G', \eta', \epsilon')$ be internal adjunctions in C, and let $(\phi_1, \psi_1, \alpha_1, \beta_1)$ and $(\phi_2, \psi_2, \alpha_2, \beta_2)$ be oplax morphisms of internal adjunctions from $(A, B, F, G, \eta, \epsilon)$ to $(A', B', F', G', \eta', \epsilon')$.

DEFINITION 3.2.1 ▶ 2-MORPHISMS BETWEEN OPLAX MORPHISMS OF INTERNAL ADJUNC-
00U3   **TIONS**

A **2-morphism from** $(\phi_1, \psi_1, \alpha_1, \beta_1)$ **to** $(\phi_2, \psi_2, \alpha_2, \beta_2)$ is a modification between these viewed as oplax transformations.

00U4   **REMARK 3.2.2 ▶ UNWINDING DEFINITION 3.2.1**

In detail, a **2-morphism from** $(\phi_1, \psi_1, \alpha_1, \beta_1)$ **to** $(\phi_2, \psi_2, \alpha_2, \beta_2)$ consist of 2-morphisms

$$\Gamma \colon \phi_1 \Longrightarrow \phi_2$$
$$\Sigma \colon \psi_1 \Longrightarrow \psi_2$$

of C such that we have equalities

$$
\begin{array}{c}
\begin{array}{ccc}
A & \xrightarrow{\ F\ } & B \\
\phi_2 \Big(\overset{\Gamma}{\Leftarrow} \Big) \phi_1 \quad \alpha_1 \Big\Vert & & \Big) \psi_1 \\
A' & \xrightarrow[\ F'\ ]{} & B'
\end{array}
\quad = \quad
\begin{array}{ccc}
A & \xrightarrow{\ F\ } & B \\
\phi_2 \Big(\quad \alpha_2 \Big\Vert \quad \psi_2 \Big(\overset{\Sigma}{\Leftarrow} \Big) \psi_1 \\
A' & \xrightarrow[\ F'\ ]{} & B'
\end{array}
\end{array}
$$

$$
\begin{array}{c}

of pasting diagrams in C.

3.3   2-Morphisms Between Strong Morphisms of Internal Adjunctions

Let C be a bicategory, let $(A, B, F, G, \eta, \epsilon)$ and $(A', B', F', G', \eta', \epsilon')$ be internal adjunctions in C, and let $(\phi_1, \psi_1, \alpha_1, \beta_1)$ and $(\phi_2, \psi_2, \alpha_2, \beta_2)$ be strong morphisms of internal adjunctions from $(A, B, F, G, \eta, \epsilon)$ to $(A', B', F', G', \eta', \epsilon')$.

DEFINITION 3.3.1 ▶ 2-MORPHISMS BETWEEN STRONG MORPHISMS OF INTERNAL ADJUNCTIONS

A **2-morphism from** $(\phi_1, \psi_1, \alpha_1, \beta_1)$ **to** $(\phi_2, \psi_2, \alpha_2, \beta_2)$ is a modification between these viewed as strong transformations.

REMARK 3.3.2 ▶ UNWINDING DEFINITION 3.3.1

In detail, a **2-morphism from** $(\phi_1, \psi_1, \alpha_1, \beta_1)$ **to** $(\phi_2, \psi_2, \alpha_2, \beta_2)$ is equivalently:

· A 2-morphism (Γ, Σ) from $(\phi_1, \psi_1, \alpha_1, \beta_1)$ to $(\phi_2, \psi_2, \alpha_2, \beta_2)$ viewed as lax transformations as in Remark 3.1.2.

· A 2-morphism (Γ, Σ) from $(\phi_1, \psi_1, \alpha_1, \beta_1)$ to $(\phi_2, \psi_2, \alpha_2, \beta_2)$ viewed as oplax transformations as in Remark 3.2.2.

00U8   3.4   2-Morphisms Between Strict Morphisms of Internal Adjunctions

Let C be a bicategory, let $(A, B, F, G, \eta, \epsilon)$ and $(A', B', F', G', \eta', \epsilon')$ be internal adjunctions in C, and let $(\phi_1, \psi_1, \alpha_1, \beta_1)$ and $(\phi_2, \psi_2, \alpha_2, \beta_2)$ be lax morphisms of internal adjunctions from $(A, B, F, G, \eta, \epsilon)$ to $(A', B', F', G', \eta', \epsilon')$.
